

## Chapter 8 - Mechanics

# Modelling in Mechanics

### Chapter Overview

1. Constructing a Model
2. Modelling Assumptions
3. Quantities and Units
4. Working with Vectors

Topics	What students need to learn:	
	Content	Guidance
<b>6</b> <b>Quantities and units in mechanics</b>	6.1 Understand and use fundamental quantities and units in the S.I. system: length, time, mass.  Understand and use derived quantities and units: velocity, acceleration, force, weight.	

# What is Mechanics?

Broadly speaking, mechanics covers motion, forces and how the two inter-relate with each other.

Mechanics, broadly speaking, concerns motion, forces, and how the two interrelate. This chapter just gives you an overview of what you'll be covering in Year 1 and how it all links together.

### Forces

You will later encounter force diagrams. This considers the forces acting at a particular point. Some forces you might consider...

- Forces can be considered as vectors.
- The **magnitude** of the force vector gives the 'size' of the force.
- We often **consider forces in a particular direction**. e.g. If the object above is stationary, the forces left must equal the force right, and forces up equal forces down (Newton's 1<sup>st</sup> Law).
- Often we need to consider the forces at multiple different points if objects are connected, e.g. with pulleys:

**The bridge!**  
 $F = ma$

Newton's 2<sup>nd</sup> Law allows us to connect the force world ( $F$ ) with the motion world (acceleration  $a$ ) if the object is moving.

### Motion

At GCSE you may have encountered displacement-time and velocity-time graphs:

Given constant acceleration we have 5 quantities of motion ("suvat"):

- $s$  = displacement
- $u$  = initial velocity
- $v$  = final velocity
- $a$  = acceleration
- $t$  = time

which we will see are linked by various equations:

$$s = ut + \frac{1}{2}at^2$$

$$s = \left(\frac{u+v}{2}\right)t$$

$$v^2 = u^2 + 2as$$

$$v = u + at$$

If the **acceleration is not constant**, we can specify displacement/velocity/acceleration as a function of time and differentiate/integrate to change between them.

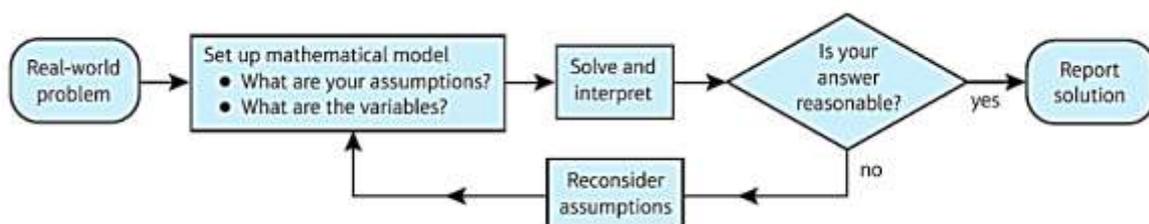

$$s = 2t^3 + 3t \rightarrow v = \frac{ds}{dt} = 6t^2 + 3$$

## 1. Constructing a Model

Why use a mathematical model?

The solution to a mathematical model needs to be interpreted in the context of the original problem. You may need to refine the model and reconsider your original assumptions.

**Example** *(Textbook)*

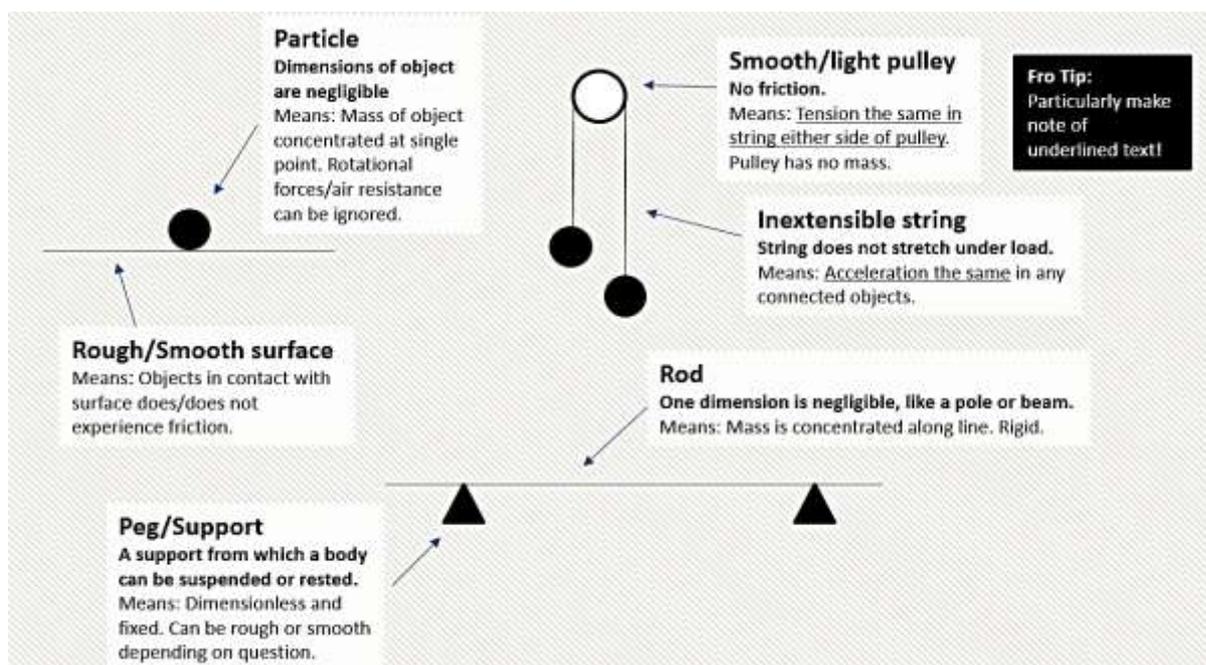

The motion of a basketball as it leaves a player's hand and passes through the net can be modelled using the equation  $h = 2 + 1.1x - 0.1x^2$ , where  $h$  m is the height of the basketball above the ground and  $x$  m is the horizontal distance travelled.

- a Find the height of the basketball:    **i** when it is released    **ii** at a horizontal distance of 0.5 m.
- b Use the model to predict the height of the basketball when it is at a horizontal distance of 15 m from the player.
- c Comment on the validity of this prediction.

## 2. Modelling Assumptions

We make modelling assumptions to simplify a problem and solve it using known mathematical techniques. You must be able to understand how these assumptions will affect calculations versus the real-life situation.

A full list of modelling assumptions is on p121 of the textbook. The most common are shown below.

### Example (Exercise 8B Question 2)

An ice puck is hit and slides across the ice.

State the effect of the following assumptions on any calculations made using this model:

- a The ice puck is modelled as a particle.      b The ice is smooth.

### 3. Quantities and Units

The SI units are a standard system of units, used internationally (“Système International d’unités”). These are the **base** ones you will use:

Quantity	Unit	Symbol
Mass	kilogram	kg
Length/displacement	metre	m
Time	seconds	s

These **derived** units are compound units built from the base units.

Quantity	Unit	Symbol
Speed/velocity	metres per second	$\text{m s}^{-1}$
Acceleration	metres per second per second	$\text{m s}^{-2}$
Weight/force	newton	$\text{N (= kg m s}^{-2}\text{)}$

Can you convert  $2.48 \times 10^5 \text{ kmh}^{-1}$  into SI units?

### Types of Force and Force Diagrams

You will encounter a variety of forces in mechanics. It is ALWAYS helpful to draw a force diagram and make sure that you have included all forces acting on a body.

- Weight (always vertically downwards)
- Normal Reaction (always perpendicular to the surface of contact)
- Friction (only if the plane is ROUGH, always opposes motion)
- Tension (in a string – PULL force)
- Thrust/compression (e.g. in a rod or engine – PUSH force)
- Resistance (e.g. particle travelling through a liquid, always opposes direction of motion)
- Buoyancy (e.g. boat floating in water, always vertically upwards)

Force diagrams can be found on page 123 of the textbook.

## 4. Working with Vectors

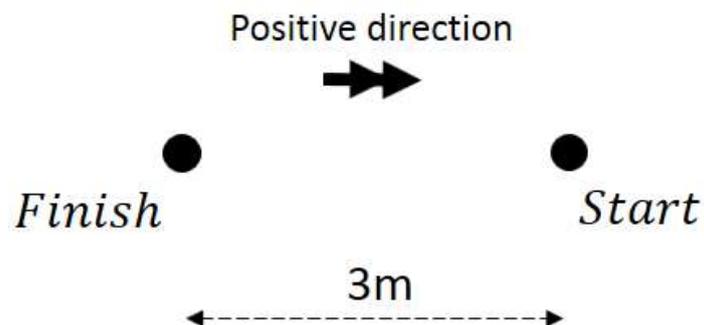

In Mechanics you will often need to convert to/from the scalar form of a quantity and the vector form.

<b>SCALAR:</b>
<b>VECTOR:</b>

Examples of scalars and vectors:

<u>Scalar</u>	<u>Vector</u>

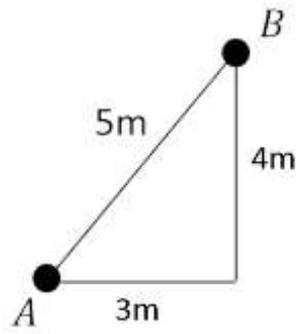

NB: 1-dimensional vectors are still different from scalars. Consider the displacement on a 1-dimensional line in a particular direction. If we'd gone backwards 3 units...

What is the distance travelled?

What is the displacement of the particle?

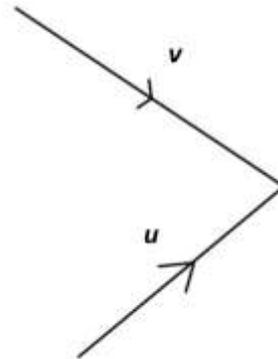

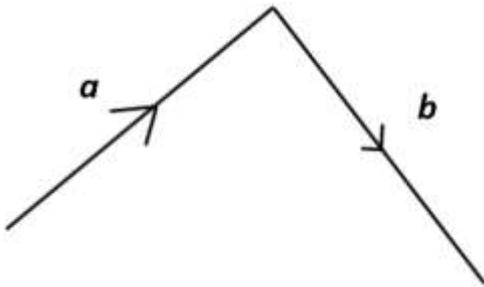

## Vector Notation

Column Notation

***i-j* Notation**  
( $i$  and  $j$  are unit vectors of length 1)

## Adding and Subtracting Vectors

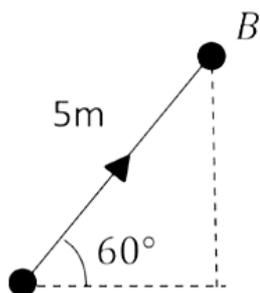

Two vectors are equal if they have the **same magnitude and direction**.

Two vectors are parallel if they have the **same direction but different magnitudes**.

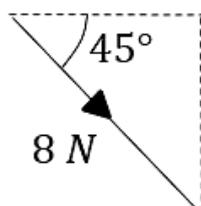

### Converting Between Vectors and Scalars

To convert to vector form, just use basic trigonometry to find the  $x$ -change and  $y$ -change.

#### Scalar (Distance)

#### Vector (Displacement)

To convert scalar form, just find the **magnitude** of the vector using Pythagoras.

#### Vector (Velocity)

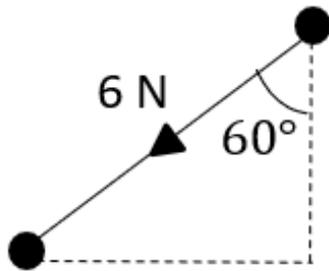

#### Scalar (Speed)

$$\begin{pmatrix} 5 \\ -12 \end{pmatrix} \text{ms}^{-1}$$

## Further Examples

Scalar Form

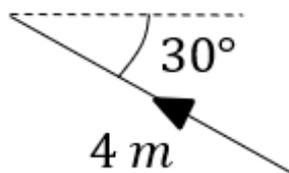

Vector Form

---

---

$$(6\mathbf{i} - 8\mathbf{j}) \text{ ms}^{-2}$$

---

### **Test Your Understanding**

A woman walks from A to B and then from B to C.

Her displacement from A to B is  $6\mathbf{i} + 4\mathbf{j}$  m.

Her displacement from B to C is  $5\mathbf{i} - 12\mathbf{j}$  m.

- a) What is the magnitude of the displacement from A to C?
- b) What is the total distance the woman has walked in getting from A to C?
